Gulf Cybersecurity Baseline

Readiness report

The Arabian Gulf against exploited vulnerabilities

Census of 23 October 2026

What the public websites of the six states announce about their software, held against CISA's catalogue of exploited vulnerabilities and against the support cycles their makers publish.

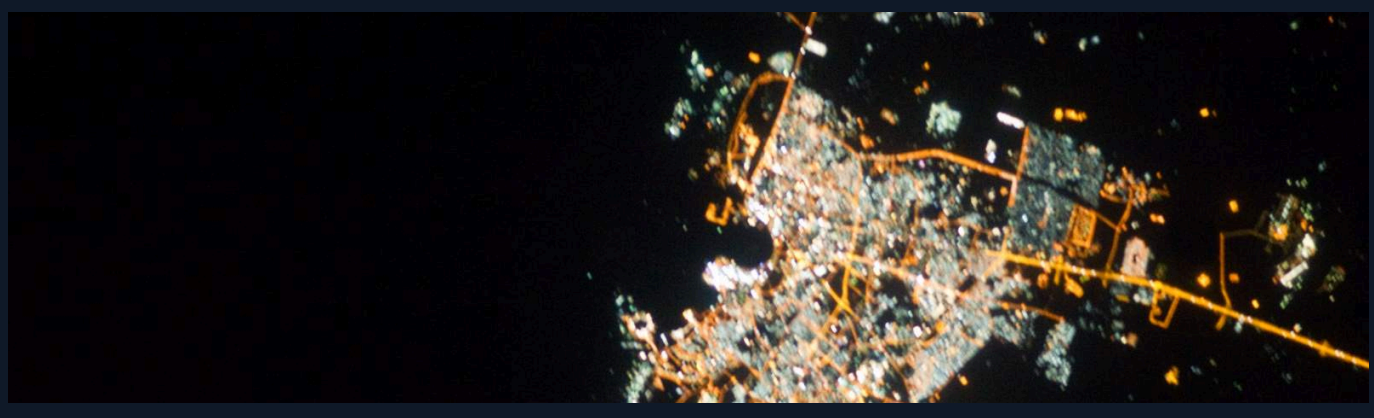

Key figures

84.8% of live domains answered with their first page
10,101 / 11,912

55.3% of the sites announcing a full Apache HTTP Server version announce one affected by CVE-2024-38475
68 of 123 announcing a full version

89.5% of the sites announcing a nginx version run one past its support
375 of 419 announcing a version

31.8% of the sites read announce the version of at least one piece of software
3,208 of 10,101 whose first page was read

Doha at night, photographed by NASA from the International Space Station on 9 December 2019.

Exploited vulnerabilities

Every vulnerability CISA has added to its catalogue of exploited vulnerabilities that affects software announced from outside, newest first, with the share of sites announcing an affected version among the sites that announce a version.

Share	Vulnerability	Affected of announcing	Catalogued
55.3%	**Apache HTTP Server CVE-2024-38475** Apache HTTP Server Improper Escaping of Output Vulnerability	68 / 123	1 May 2025
0.4%	**PHP CVE-2024-4577** PHP-CGI OS Command Injection Vulnerability Used in ransomware campaigns	4 / 1,097	12 June 2024
0.0%	**OpenSSL CVE-2014-0160** OpenSSL Information Disclosure Vulnerability	0 / 32	4 May 2022
0.3%	**PHP CVE-2012-1823** PHP-CGI Query String Parameter Vulnerability	3 / 1,097	25 March 2022
0.0%	**Drupal CVE-2020-13671** Drupal core Un-restricted Upload of File	0 / 65	18 January 2022
0.0%	**Apache HTTP Server CVE-2021-42013** Apache HTTP Server Path Traversal Vulnerability Used in ransomware campaigns	0 / 123	3 November 2021
0.0%	**Apache HTTP Server CVE-2021-41773** Apache HTTP Server Path Traversal Vulnerability Used in ransomware campaigns	0 / 123	3 November 2021
8.1%	**Apache HTTP Server CVE-2019-0211** Apache HTTP Server Privilege Escalation Vulnerability	10 / 123	3 November 2021
0.0%	**Drupal CVE-2018-7600** Drupal Core Remote Code Execution Vulnerability Used in ransomware campaigns	0 / 87	3 November 2021
0.4%	**Microsoft IIS CVE-2017-7269** Microsoft Windows Server Buffer Overflow Vulnerability	2 / 539	3 November 2021

And 7 more in Apache Tomcat and Joomla, which no site announces a full version of, so they are not measured yet.

Software past its support

Among the sites that announce the version of their software, the share running a version its maker no longer supports according to endoflife.date, so it receives no security patches.

Share	Software	Past support of announcing	Most common cycles
0.1%	WordPress	2 / 1,448	7.1 · 7.0 · 6.9
27.9%	PHP	306 / 1,097	8.3 · 8.2 · 7.4
3.9%	Microsoft IIS	21 / 539	10.0 · 8.5 · 7.5
89.5%	nginx	375 / 419	1.29 · 1.24 · 1.18
2.2%	Apache HTTP Server	3 / 135	2.4 · 2.2
12.5%	Drupal	13 / 104	7
75.0%	OpenSSL	24 / 32	1.0.2 · 1.1.1 · 3.5

What sites announce

Only what a site writes about itself in the headers of its first page or in its generator tag is measured, so the figures are a floor, and sites behind a front such as Cloudflare do not announce their server.

79.4%	Announce their server	8,025 / 10,101
31.8%	Announce a software version	3,208 / 10,101
27.2%	Announce their content system	2,744 / 10,101
37.8%	Behind a front that hides the server	3,819 / 10,101

Method and limits

The first page of every live domain is requested once, as any browser would, and its Server and X-Powered-By headers and the generator tag in its first 64 kilobytes are read, and nothing else is asked of the site.

The vulnerabilities come from CISA's catalogue of exploited vulnerabilities, the affected version ranges from NVD and the support cycles from endoflife.date, and all three are refreshed with every measurement.

It is measured after every weekly issue and within a day of a new entry for visible software, no domain is named and the states are never ranked.

A site can announce a version older than its code when its distribution backports the fixes, as Red Hat and Debian do, and it can announce only its major, in which case it is counted only when every version under it is affected or none is, so the share measures what a site announces, not exactly what runs inside it.

Each state has its own figures on its own page of the site, never set beside another, and no domain is named.
